

CRYOARKS

Is there more than one type of biobank?

Yes! Biobanks can focus on storing different types of samples. You may have heard of seed banks which store plant seed material, well CryoArks is a zoological biobank which stores samples from animals.

All biobanks hold a large amount of samples to be used in research. They need to be well organised so you can find things! They are a bit like a library, only instead of books biobanks store tubes.

Can you help us organise our samples? They are labelled with letters and should be in alphabetical order in the box.

Write the label for where each sample should be stored in the box, so we can find them all again!
